

NAME: ASIF ERFAN KHAN

ROLL NUMBER: 546

COURSE: MSc CS

SUBJECT: BUSINESS

**INTELLIGENCE & BIG DATA
ANALYSIS**

PRACTICAL: 1-9

SR No	Name	Date	Sign
1	To Install Cloudera QuickStart VM on VMware		
2	Map-Reduce Program for WordCount Problem		
3	PIG Script for Solving Counting Problems		
4	Install HBase and Use HBase Data Model to Store and Retrieve Databases		
5	Install Hive and Use Hive to Create and Store Structured Databases		
6	Construct Different Types of K-Shingles for Given Document		
7	Measuring Similarity Among Documents and Detecting Passages Which Have Been Reused		
8	Computing n-moment		
9	Alon-Matias-Szegedy Algorithm		

Practical 1: To Install Cloudera QuickStart VM on VMware

Cloudera is software that provides a platform for data analytics, data warehousing, and machine learning. Initially, Cloudera started as an open-source Apache Hadoop distribution project, commonly known as Cloudera Distribution for Hadoop or CDH. It contains Apache Hadoop and other related projects where all the components are 100% open-source under Apache License.

Cloudera provides virtual machine images of complete Apache Hadoop clusters, making it easy to get started with Cloudera CDH. This assignment covers the following topics related to Cloudera QuickStart VM Installation:

1. What is Cloudera QuickStart VM?
2. Prerequisites for Cloudera QuickStart VM Installation
3. Downloading the Cloudera QuickStart VM
4. Cloudera QuickStart VM Installation on Windows

What is Cloudera QuickStart VM?

Cloudera QuickStart VM includes everything you need for using CDH, Impala, Cloudera Search, and Cloudera Manager. The Cloudera QuickStart VM uses a package-based install that allows you to work with or without the Cloudera Manager. It provides a sample of Cloudera's platform for "Big Data."

Prerequisites for Cloudera QuickStart VM Installation

- A virtual machine such as Oracle VirtualBox or VMware
- RAM of 12+ GB, that is 4+ GB for the operating system and 8+ GB for Cloudera
- 80 GB hard disk
- Oracle VirtualBox downloaded from <https://www.virtualbox.org/wiki/Downloads> and installed on your system

Downloading the Cloudera QuickStart VM

- Cloudera QuickStart VMs are available as Zip archives in VirtualBox, VMware, and KVM formats. To download the VM, go to <https://www.cloudera.com/downloads.html> and select the appropriate version of CDH that you require.
- Click on the "GET IT NOW" button, and it will prompt you to fill in your details.

- Once the file is downloaded, go to the download folder and unzip the files. They can then be used to set up a single-node Cloudera cluster.

The two virtual images of Cloudera QuickStart VM are shown below:

Name	Date modified	Type	Size
 cloudera-quickstart-vm-5.13.0-0-vmware	20-03-2023 04:56 PM	File folder

- Now that the downloading process is done with, let's move forward with this Cloudera QuickStart VM Installation guide and see the actual process.

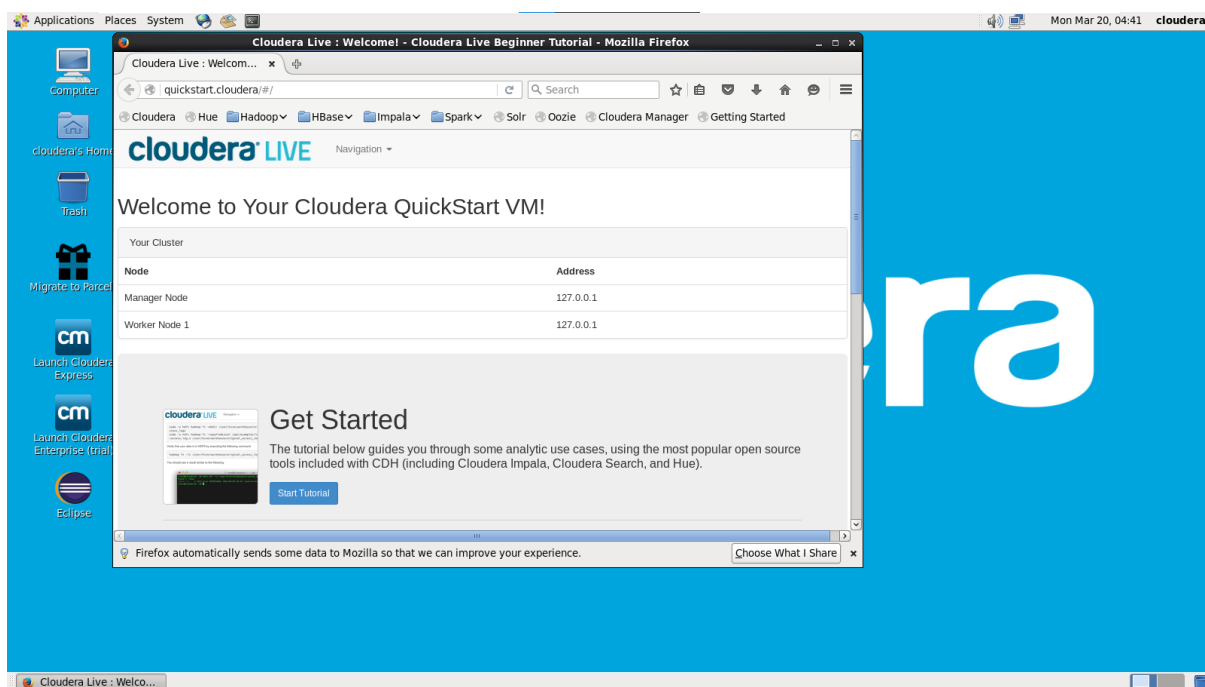

Cloudera QuickStart VM Installation

- Before setting up the Cloudera Virtual Machine, you would need to have a virtual machine such as VMware or Oracle VirtualBox on your system.
- In this case, we are using Oracle VirtualBox to set up the Cloudera QuickStart VM.
- In order to download and install the Oracle VirtualBox on your operating system, click on the following link: Oracle VirtualBox(<https://www.virtualbox.org/wiki/Downloads>).

- To set up the Cloudera QuickStart VM in your Oracle VirtualBox Manager, click on file with extension as “.VMX “ and then it will automatically open in VMware Workstation.
- Once complete you can see the Cloudera QuickStart VM on the left side panel.

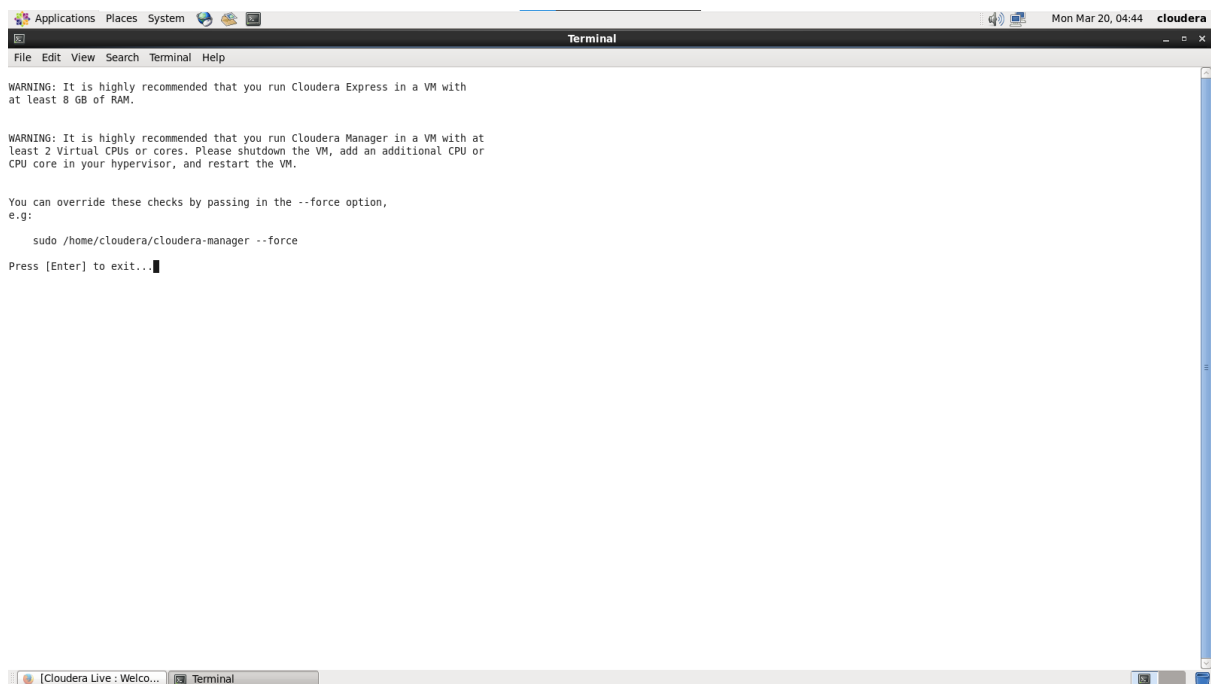

- The next step will be going ahead and starting the machine by clicking the ‘Start’ symbol on top.
- Once your machine comes on, it will look like this:

- Next, we have to follow a few steps to gain admin console access. You need to click on the terminal present on top of the desktop screen, and type in the following:

1. `hostname #` This shows the hostname which will be `quickstart.cloudera`
 2. `hdfs dfs -ls / #` Checks if you have access and if your cluster is working. It displays what exists on your HDFS location by default
 3. `service cloudera-scm-server status #` Tells what command you have to type to use cloudera express free
 4. `su - #` Login as root
 5. `service cloudera-scm-server status #` The password for root is cloudera
- Once you see that your HDFS access is working fine, you can close the terminal. Then, you have to click on the following icon that says 'Launch Cloudera Express'.

- You are required to copy the command, and run it on a separate terminal. Hence, open a new terminal, and use the below command to close the Cloudera based services. It will restart the services, after which you can access your admin console.

```
File Machine View Input Devices Help
Applications Places System
Browse and run installed applications cloudera@quickstart:~
File Edit View Search Terminal Help
[cloudera@quickstart ~]$ sudo /home/cloudera/cloudera-manager --force --express
[QuickStart] Shutting down CDH services via init scripts...
kafka-server: unrecognized service
[QuickStart] Disabling CDH services on boot...
error reading information on service kafka-server: No such file or directory
[QuickStart] Starting Cloudera Manager server...
[QuickStart] Waiting for Cloudera Manager API...
[QuickStart] Starting Cloudera Manager agent...
[QuickStart] Configuring deployment...
[QuickStart] Deploying client configuration...
[QuickStart] Starting Cloudera Management Service...
[QuickStart] Enabling Cloudera Manager daemons on boot...

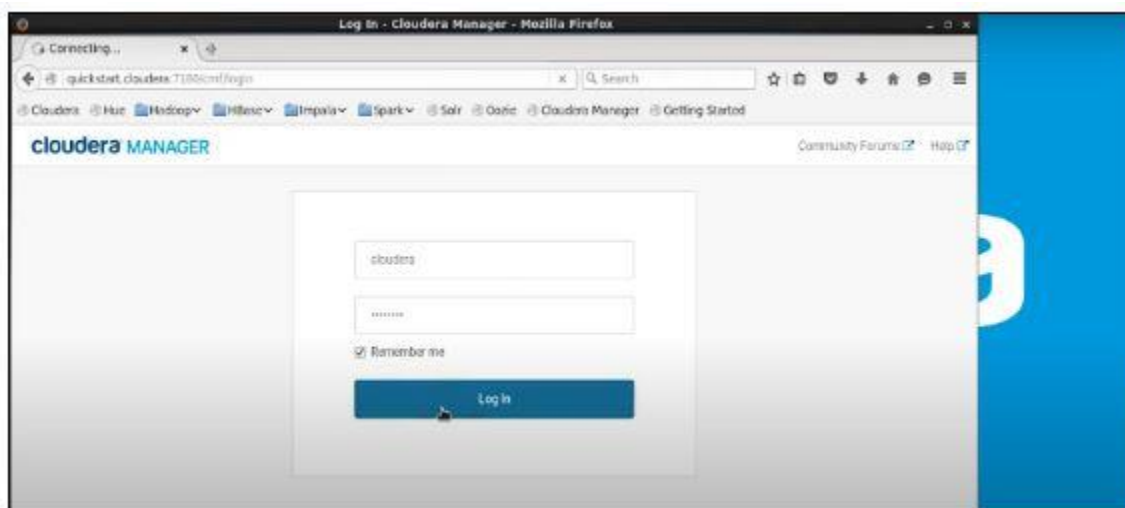

Success! You can now log into Cloudera Manager from the QuickStart VM's browser:

http://quickstart.cloudera:7180

Username: cloudera
Password: cloudera

[cloudera@quickstart ~]$
```

- Now that our deployment has been configured, client configurations have also been deployed. Additionally, it has restarted the Cloudera Management Service, which gives access to the Cloudera QuickStart admin console with the help of a username and password.
- Go on and open up the browser and change the port number to 7180.
- You can log in to the Cloudera Manager by providing your username and password.

- You can go ahead and restart the services now. It will ensure that the cluster becomes accessible either by Hue as a web interface or Cloudera QuickStart Terminal, where you can write your commands.

Practical 2: Map-Reduce Program for WordCount Problem

Commands:

```
[cloudera@quickstart ~]$ hdfs dfs -ls /
[cloudera@quickstart ~]$ sudo -u hdfs hadoop fs -mkdir /inputdirectory
[cloudera@quickstart ~]$ hdfs dfs -ls /
[cloudera@quickstart ~]$ cat>/home/cloudera/processfile.txt
[cloudera@quickstart ~]$ sudo -u hdfs hadoop fs -put
/home/cloudera/processfile.txt /inputdirectory
[cloudera@quickstart ~]$ hdfs dfs -ls /inputdirectory
[cloudera@quickstart ~]$ hadoop jar /home/cloudera/WordCount.jar WordCount
/inputdirectory/processfile.txt /out1
[cloudera@quickstart ~]$ hdfs dfs -ls /out1
[cloudera@quickstart ~]$ hdfs dfs -cat /out1/part-r-00000
```

OUTPUT

```

hbase(main):003:0> table help
Help for table-reference commands.

You can either create a table via 'create' and then manipulate the table via commands like 'put', 'get', etc.
See the standard help information for how to use each of these commands.

However, as of 0.96, you can also get a reference to a table, on which you can invoke commands.
For instance, you can get create a table and keep around a reference to it via:

hbase> t = create 't', 'cf'

Or, if you have already created the table, you can get a reference to it:

hbase> t = get_table 't'

You can do things like call 'put' on the table:

hbase> t.put 'r', 'cf:q', 'v'

which puts a row 'r' with column family 'cf', qualifier 'q' and value 'v' into table t.

To read the data out, you can scan the table:

hbase> t.scan

which will read all the rows in table 't'.

Essentially, any command that takes a table name can also be done via table reference.
Other commands include things like: get, delete, deleteall,
get all columns, get counter, count, incr. These functions, along with
the standard JRuby object methods are also available via tab completion.

For more information on how to use each of these commands, you can also just type:
```

```
Applications Places System cloudera@quickstart:~
cloudera@quickstart:~
File Edit View Search Terminal Help
For more information on how to use each of these commands, you can also just type:

hbase> t.help 'scan'

which will output more information on how to use that command.

You can also do general admin actions directly on a table; things like enable, disable,
flush and drop just by typing:

hbase> t.enable
hbase> t.flush
hbase> t.disable
hbase> t.drop

Note that after dropping a table, your reference to it becomes useless and further usage
is undefined (and not recommended).

hbase(main):004:0> whoami
cloudera (auth:SIMPLE)
groups: cloudera, default

hbase(main):005:0> create 'employee', 'Name', 'ID', 'Designation', 'Salary', 'Department'
ERROR: wrong number of arguments (0 for 1)

Creates a table. Pass a table name, and a set of column family
specifications (at least one), and, optionally, table configuration.
Column specification can be a simple string (name), or a dictionary
(dictionaries are described below in main help output), necessarily
including NAME attribute.
Examples:

Create a table with namespace=ns1 and table qualifier=t1
hbase> create 'ns1:t1', {NAME => 'f1', VERSIONS => 5}

Create a table with namespace=default and table qualifier=t1
hbase> create 't1', {NAME => 'f1'}, {NAME => 'f2'}, {NAME => 'f3'}
hbase> # The above in shorthand would be the following:
hbase> create 't1', 'f1', 'f2', 'f3'
hbase> create 't1', {NAME => 'f1', VERSIONS => 1, TTL => 2592000, BLOCKCACHE => true}
hbase> create 't1', {NAME => 'f1', CONFIGURATION => {'hbase.hstore.blockingStoreFiles' => '10'}}
hbase> create 't1', {NAME => 'f1', IS_MOB => true, MOB_THRESHOLD => 1000000, MOB_COMPACT_PARTITION_POLICY => 'weekly'}

Table configuration options can be put at the end.
Examples:
```

```
Practical 2 (Map-Redu... cloudera@quickstart:~
Applications Places System cloudera@quickstart:~
cloudera@quickstart:~
File Edit View Search Terminal Help
hbase> create 'ns1:t1', 'f1', SPLITS => {'10', '20', '30', '40'}
hbase> create 't1', 'f1', SPLITS => {'10', '20', '30', '40'}
hbase> create 't1', 'f1', SPLITS FILE => 'splits.txt', OWNER => 'johndoe'
hbase> create 't1', {NAME => 'f1', VERSIONS => 5, METADATA => { 'mykey' => 'myvalue' }}
hbase> # Optionally pre-split the table into NUMREGIONS, using
hbase> # SPLITALGO ("HexStringSplit", "UniformSplit" or classname)
hbase> create 't1', 'f1', {NUMREGIONS => 15, SPLITALGO => 'HexStringSplit'}
hbase> create 't1', 'f1', {NUMREGIONS => 15, SPLITALGO => 'HexStringSplit', REGION_REPLICATION => 2, CONFIGURATION => {'hbase.hregion.scan.loadColumnFamiliesOnDemand' => 'true'}}
hbase> create 't1', {NAME => 'f1', DFS_REPLICATION => 1}

You can also keep around a reference to the created table:

hbase> t1 = create 't1', 'f1'

Which gives you a reference to the table named 't1', on which you can then
call methods.

[cloudera@quickstart ~]$ hbase shell

Scan a table: pass table name and optionally a dictionary of scanner
specifications. Scanner specifications may include one or more of:
TIMERANGE, FILTER, LIMIT, STARTROW, STOPROW, ROWPREFIXFILTER, TIMESTAMP,
MAXLENGTH or COLUMNS, CACHE or RAW, VERSIONS, ALL_METRICS or METRICS
If no columns are specified, all columns will be scanned.
To scan all members of a column family, leave the qualifier empty as in
'col family'.
The filter can be specified in two ways:
1. Using a filterString - more information on this is available in the
Filter Language document attached to the HBASE-4176 JIRA
2. Using the entire package name of the filter.
If you wish to see metrics regarding the execution of the scan, the
ALL_METRICS boolean should be set to true. Alternatively, if you would
prefer to see only a subset of the metrics, the METRICS array can be
defined to include the names of only the metrics you care about.
Some examples:
    hbase> scan 'hbase:meta'
    hbase> scan 'hbase:meta', {COLUMNS => 'info:regioninfo'}
    hbase> scan 'ns1:t1', {COLUMNS => ['c1', 'c2'], LIMIT => 10, STARTROW => 'xyz'}
    hbase> scan 't1', {COLUMNS => ['c1', 'c2'], LIMIT => 10, STARTROW => 'xyz'}
    hbase> scan 't1', {COLUMNS => 'c1', TIMERANGE => [1303668804, 1303668904]}
    hbase> scan 't1', {REVERSED => true}
    hbase> scan 't1', {ALL_METRICS => true}
    hbase> scan 't1', {METRICS => ['RPC_RETRIES', 'ROWS_FILTERED']}
    hbase> scan 't1', {ROWPREFIXFILTER => 'row2', FILTER => "
    (QualifierFilter (=>, 'binary:xyz')) AND (TimestampFilter ( 123, 456))"}
    hbase> scan 't1', {FILTER =>
    org.apache.hadoop.hbase.filter.ColumnPaginationFilter.new(1, 0)}
    hbase> scan 't1', {CONSISTENCY => 'TIMELINE'}
For setting the Operation Attributes
    hbase> scan 't1', { COLUMNS => ['c1', 'c2'], ATTRIBUTES => {'mykey' => 'myvalue'}}
    hbase> scan 't1', { COLUMNS => ['c1', 'c2'], AUTHORIZATIONS => ['PRIVATE', 'SECRET']}
For experts, there is an additional option -- CACHE_BLOCKS -- which
switches block caching for the scanner on (true) or off (false). By
default it is enabled. Examples:
    hbase> scan 't1', {COLUMNS => ['c1', 'c2'], CACHE_BLOCKS => false}
Also for experts, there is an advanced option -- RAW -- which instructs the
scanner to return all cells (including delete markers and uncollected deleted
```

```
Applications Places System cloudera@quickstart:~
File Edit View Search Terminal Help
Disabled by default. Example:
hbase> scan 't1', {RAW => true, VERSIONS => 10}

Besides the default 'toStringBinary' format, 'scan' supports custom formatting
by column. A user can define a FORMATTER by adding it to the column name in
the scan specification. The FORMATTER can be stipulated:

1. either as a org.apache.hadoop.hbase.util.Bytes method name (e.g. toInt, toString)
2. or as a custom class followed by method name: e.g. 'c(MyFormatterClass).format'.

Example formatting cf:qualifier1 and cf:qualifier2 both as Integers:
hbase> scan 't1', {COLUMNS => ['cf:qualifier1:toInt',
'cf:qualifier2:c(org.apache.hadoop.hbase.util.Bytes).toInt']}

Note that you can specify a FORMATTER by column only (cf:qualifier). You cannot
specify a FORMATTER for all columns of a column family.

Scan can also be used directly from a table, by first getting a reference to a
table, like such:

hbase> t = get_table 't'
hbase> t.scan

Note in the above situation, you can still provide all the filtering, columns,
options, etc as described above.

Practical 5: Install Hive and Use Hive to Create and Store Structured Databases

Commands:

```
cat > /home/cloudera/employee.txt
cat /home/cloudera/employee.txt
sudo -u hdfs hadoop fs -put /home/cloudera/employee.txt /inputdirectroy
hdfs dfs -ls /inputdirectory
hadoop fs -cat /inputdirectory/employee.txt
hive
show databases;
create database organization;
show databases;
use organization;
show tables;
hive> create table employee(
    > id int,
    > name string,
    > city string,
    > department string,
    > salary int,
    > domain string)
    > row format delimited
    > fields terminated by '~';

show tables;
select * from employee;
show tables;
load data inpath '/inputdirectory/employee.txt' overwrite into table employee;
show tables;
select * from employee;
```

OUTPUT

Practical 6: Construct Different Types of K-Shingles for Given Document

Code:

```
# Install necessary packages
install.packages("tm")
require("tm")
install.packages("devtools")

# Define function to read an integer and create shingles from a file
readinteger <- function() {
  n <- readline(prompt = "Enter value of k-1: ") # Prompt user for input
  k <- as.integer(n) # Convert input to integer
  u1 <- readLines("C:/Users/asif0/Documents/File1.txt") # Read in file
  Shingle <- 0 # Initialize variable for storing shingles
  i <- 0 # Initialize loop counter
  while (i < nchar(u1) - k + 1) { # Loop through file, creating shingles
    Shingle[i] <- substr(u1, start = i, stop = i + k) # Extract shingle
    # Print shingle to console
    print(Shingle[i])
    i <- i + 1 # Increment loop counter
  }
}

# Call readinteger function if running interactively
if (interactive()) {
  readinteger()
}
```

OUTPUT

Enter value of k-1: 4

character(0)

```
[1] "This "  
[1] "his i"

```

Practical 7: Measuring Similarity Among Documents and Detecting Passages Which Have Been Reused

Codes:

```
# Install necessary packages
install.packages("tm")
require("tm")
install.packages("ggplot2")
install.packages("textreuse")
install.packages("devtools")

# Load in corpus and preprocess text
my.corpus <- Corpus(DirSource("C:/Users/asif0/Documents/New folder")) # Load
in corpus from directory
my.corpus <- tm_map(my.corpus, removeWords, stopwords("english")) # Remove
stop words from corpus

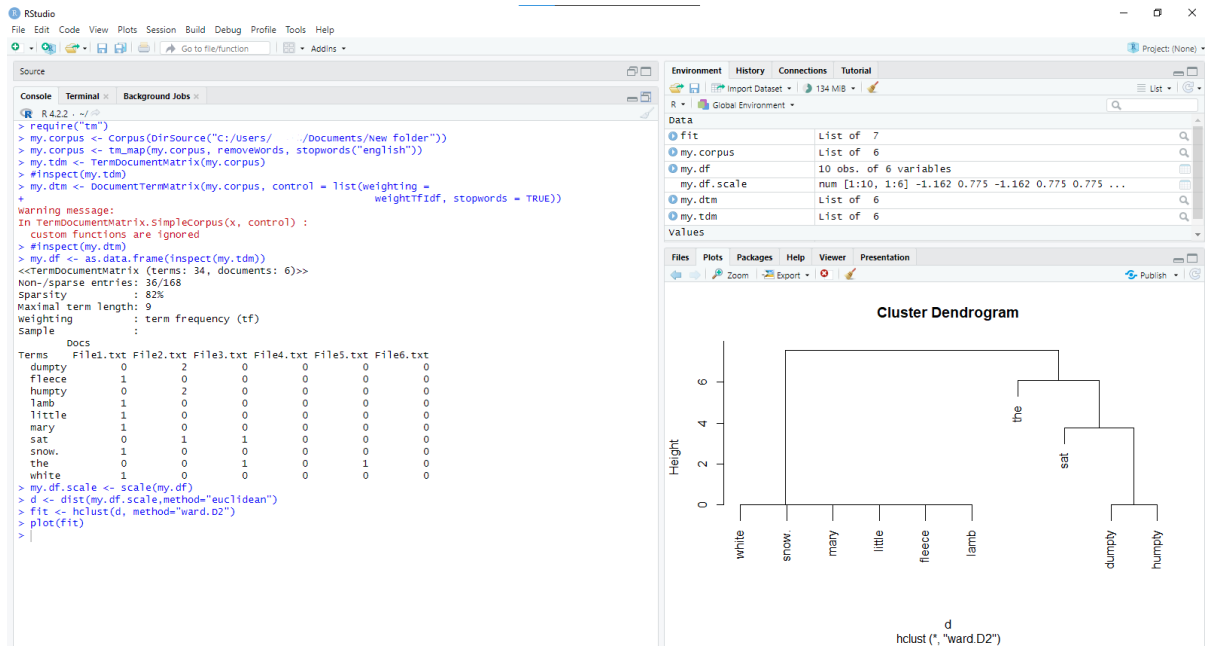

# Create term-document matrix
my.tdm <- TermDocumentMatrix(my.corpus) # Create term-document matrix from
corpus
#inspect(my.tdm) # Inspect term-document matrix (optional)

# Create document-term matrix
my.dtm <- DocumentTermMatrix(my.corpus, control = list(weighting =
weightTfIdf, stopwords = TRUE)) # Create document-term matrix from corpus,
using TF-IDF weighting and removing stop words
#inspect(my.dtm) # Inspect document-term matrix (optional)

# Convert document-term matrix to data frame and scale data
my.df <- as.data.frame(inspect(my.tdm)) # Convert document-term matrix to
data frame
my.df.scale <- scale(my.df) # Scale data using z-score normalization

# Perform hierarchical clustering and plot dendrogram
d <- dist(my.df.scale, method = "euclidean") # Calculate distance matrix
using Euclidean distance
fit <- hclust(d, method = "ward") # Perform hierarchical clustering using
Ward's method
plot(fit) # Plot dendrogram
```

OUTPUT:

Practical 8: Compute n-moment

Codes:

```
import java.io.*;
import java.util.*;

public class n_moment {
    public static void main(String args[]) {
        int n = 15; // Total number of elements in the stream
        String stream[] = {"a", "b", "c", "b", "d", "a", "c", "d", "a", "b",
"d", "c", "a", "a", "b"};
        int zero_moment = 0, first_moment = 0, second_moment = 0, count = 1,
flag = 0;
        ArrayList<Integer> arrlist = new ArrayList(); // Creating a new
ArrayList

        System.out.println("Arraylist elements are::");
        for (int i = 0; i < 15; i++) {
            System.out.println(stream[i] + " "); // Printing the elements of
the stream
        }

        Arrays.sort(stream); // Sorting the elements of the stream

        for (int i = 1; i < n; i++) {
            if (stream[i] == stream[i - 1]) { // If current element is same as
previous element
                count++; // Increment the count
            } else {
                // System.out.println("Hello"+i);
                arrlist.add(count); // Add the count to the ArrayList
                count = 1; // Reset the count
            }
        }
        arrlist.add(count); // Add the last count to the ArrayList

        zero_moment = arrlist.size(); // Zeroth moment is the size of the
ArrayList
        System.out.println("\n\nValue of Zeroth moment for given stream::" +
zero_moment);

        for (int i = 0; i < arrlist.size(); i++) {
            first_moment += arrlist.get(i); // Summing up all the elements in
the ArrayList
        }
        System.out.println("\n\nValue of First moment for given stream::" +
first_moment);
    }
}
```

```

        for (int i = 0; i < arrlist.size(); i++) {
            int j = arrlist.get(i);
            second_moment += (j * j); // Computing the second moment by
summing up the squares of all elements in the ArrayList
        }
        System.out.println("\n\nValue of Second moment for given stream::" +
second_moment);
    }
}

```

OUTPUT

```

Arraylist elements are::a
b
c b
d
a
c d
a
b
d c
a
a b
Value of Zeroth moment for given stream::4
Value of First moment for given stream::15

Value of Second moment for given stream::59

```

Practical 9: Alon-Matias-Szegedy Algorithm

Codes:

```
import java.io.*;
import java.util.*;

class AMSA {
    public static int findCharCount(String stream, char XE, int random, int n) {
        int countoccurance = 0;
        for (int i = random; i < n; i++) {
            if (stream.charAt(i) == XE) {
                countoccurance++;
            }
        }
        return countoccurance;
    }

    public static int estimateValue(int XV1, int n) {
        int ExpValue;
        ExpValue = n * (2 * XV1 - 1);
        return ExpValue;
    }

    public static void main(String args[]) {
        int n = 15;
        String stream = "abcbdacdbdcaab";
        int random1 = 3, random2 = 8, random3 = 13;
        char XE1, XE2, XE3;
        int XV1, XV2, XV3;
        int ExpValuXE1, ExpValuXE2, ExpValuXE3;
        int apprSecondMomentValue;

        // Select three random characters from the stream
        XE1 = stream.charAt(random1 - 1);
        XE2 = stream.charAt(random2 - 1);
        XE3 = stream.charAt(random3 - 1);

        // Count the number of occurrences of each character in the stream
        XV1 = findCharCount(stream, XE1, random1 - 1, n);
        XV2 = findCharCount(stream, XE2, random2 - 1, n);
        XV3 = findCharCount(stream, XE3, random3 - 1, n);

        // Print the counts of the selected characters
        System.out.println(XE1 + "=" + XV1 + " " + XE2 + "=" + XV2 + " " + XE3 +
            "=" + XV3);

        // Estimate the expected value for each selected character
        ExpValuXE1 = estimateValue(XV1, n);
```

```

ExpValuXE2 = estimateValue(XV2, n);
ExpValuXE3 = estimateValue(XV3, n);

// Print the expected values for each selected character
System.out.println("Expected value for" + XE1 + " is::" + ExpValuXE1);
System.out.println("Expected value for" + XE2 + " is::" + ExpValuXE2);
System.out.println("Expected value for" + XE3 + " is::" + ExpValuXE3);

// Compute the approximate second moment value using Alon-Matias-Szegedy
algorithm
apprSecondMomentValue = (ExpValuXE1 + ExpValuXE2 + ExpValuXE3) / 3;
System.out.println("approximate second moment value using alon-matis-
szegedy is::" + apprSecondMomentValue);
}
}

```

OUTPUT

```

c=3 d=2 a=2
Expected value for c is::75
Expected value for d is::45
Expected value for a is::45
approximate second moment value using alon-matis-szegedy is::55

```
